DOCUMENT PURPOSE

The purpose of the Digital Token Identifier (DTI) Implementation Guidelines document is to:

- Provide clarity on the scope of products to be assigned DTIs by the DTIF
- Illustrate the DTI issuance process
- Describe data elements required to issue a DTI to a token
- Explain the data validation steps provided by DTIF
- Provide guidance on the dispute process

Both the document and scope will be periodically reviewed to ensure its applicability in meeting the evolving needs of the industry.

ISO 24165 SCOPE

The scope of DTI issuance is all fungible digital assets which use distributed ledger technology for their issuance, storage, exchange, record of ownership, or transaction validation and are not a “fiat” currency (as defined by ISO 4217).

Digital assets can also be described as cryptocurrency, virtual currency, digital currency, utility token, security token, cryptoasset, payment token, stablecoin, colored coin.

DTIF as a Registration Authority (RA) will assess the eligibility of the token to be issued with a DTI and reserves the right not to issue DTI if the token does not meet the above requirements.

DTI REQUESTS FOR TOKEN REGISTRATION

All digital token registration requests should be submitted via the helpdesk portal on the DTIF website. Prior to submitting a request, users must register through the portal and confirm their email address.

Once the request has been made, the DTIF will verify the information supplied by the registrant to ensure that:

1. The token exists and is eligible for DTI
2. The token has not been issued a DTI already
3. Normative and/or Informative data supplied by the registrant meets the validation criteria

General Guidelines

- Registration eligibility is based on objective, verifiable information provided by the registrant.
- The assignment of the identifier offers no warranty on the features, purpose, compliance to any regulation, or value of the digital token
- The identifier is assigned to the token, not registered to the registrant.
- Registration can be rejected if objective data associated with the token has already been assigned to an identifier
The information set out within this digital token identifier registry is provided for general information only. It is not intended to amount to advice on which you should rely and you must obtain professional or specialist advice before taking, or refraining from taking, any action on the basis of this information.

Notwithstanding our allocation and registration of a digital token identifier in respect of a digital token and/or our inclusion of a digital token within this digital token identifier registry, we do not endorse any digital token in any way and we provide no warranties as to the features, functions, legal status, suitability for investment, or regulatory status of any digital token.

Native Digital Token Registration Request

A native token is defined as having a privileged position in the distributed ledger technology (DLT) protocol (e.g. Bitcoin-BTC or Ethereum-ETH).

The same registration form should be used for DLTs without a native digital token or where a DLT has more than one native digital token (e.g. THETA/TFUEL).

Listed in the next section are all the data elements for registration of native digital tokens. While only Digital Token Long Name is mandatory in the registration process, providing additional information will greatly reduce validation and assignment time.

If relevant, use the comments section in the form to add any other details that will help DTIF to verify the application.
## Native Digital Token Form Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital Token Long Name</td>
<td>String containing the full name of the digital token, as represented in alphanumeric basic Latin characters</td>
</tr>
<tr>
<td>Distribution Ledger Technology Type</td>
<td>For example, Bitcoin and Ethereum use blockchain-based distributed ledgers. IOTA utilizes a directed acyclic graph for its distributed ledger, which is not a blockchain, and thus would be considered distributed ledger technology: Other.</td>
</tr>
<tr>
<td>Digital Token Short Name(s)</td>
<td>One or more short names or ticker symbols used to represent this digital token. Multiple symbols can be added to the same identifier (if applicable)</td>
</tr>
<tr>
<td>Add original Language Name</td>
<td>Tick “Yes” if the token has a long or a short name in the original language that is different from the long short names already specified. Additional fields will appear to add Original Language Names</td>
</tr>
<tr>
<td>Genesis Block Hash</td>
<td>Block hash of the first block (Block 0) on the chain</td>
</tr>
<tr>
<td>Genesis Block Hash Algorithm</td>
<td>Algorithm used to produce the genesis block hash e.g. SHA-256</td>
</tr>
<tr>
<td>Genesis Block UTC Timestamp</td>
<td>Expressed in Coordinated Universal Time (YYYY-MM-DDTHH:MM:SS)</td>
</tr>
<tr>
<td>Digital Token Reference Implementation URL</td>
<td>Uniform Resource Locator (URL) pointing to the digital token’s reference implementation or software repository</td>
</tr>
<tr>
<td>Digital Token Unit Multiplier</td>
<td>Multiplier used to map from the unit of value stored on the distributed ledger to the unit of value associated with the digital token long name. For example unit multiplier for Bitcoin is 8 or 100000000</td>
</tr>
<tr>
<td>Token Explorer</td>
<td>URL to token explorer page</td>
</tr>
<tr>
<td>Official Website</td>
<td>URL to the website about your token</td>
</tr>
<tr>
<td>Whitepaper</td>
<td>URL to token whitepaper page</td>
</tr>
<tr>
<td>Source Code</td>
<td>URL to repository for token’s code implementation</td>
</tr>
<tr>
<td>Add External Identifiers</td>
<td>Tick “Yes” if the token has any identifiers, external to this standard, that may be used to identify either the digital token or the underlying asset that this digital token represents. Additional fields will appear to add either underlying asset or a digital token. Please use the following format: Type:Identifier, e.g. ISIN:GB0071262223 or ITIN:31R25SHC9</td>
</tr>
<tr>
<td>Forks</td>
<td>Please add fork block heights for all known forks (hard &amp; soft).</td>
</tr>
</tbody>
</table>
Auxiliary Digital Token Registration Process

Auxiliary Digital Token Registration Request: An auxiliary token is defined as a non-native digital token created as an application on distributed ledger (e.g. ERC-20 tokens).

Listed in the next section are all the data elements for registration of native digital tokens. While only Digital Token Long Name is mandatory in the registration process, providing additional information will greatly reduce verification and assignment time.

If relevant, use the comments section in the form to add any other details that will help DTIF to verify the application, including details of the auxiliary digital token ledger and mechanism if left as Other.
## Auxiliary Digital Token Form Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital Token Long Name</td>
<td>String containing the full name of the digital token, as represented in alphanumeric basic Latin characters</td>
</tr>
<tr>
<td>Digital Token Short Name(s)</td>
<td>One or more short names or ticker symbols used to represent this digital token</td>
</tr>
<tr>
<td></td>
<td>Multiple symbols can be added to the same identifier (if applicable)</td>
</tr>
<tr>
<td>Add original Language Name</td>
<td>Tick “Yes” if the token has a long or a short name in the original language that is different from the long short names already specified.</td>
</tr>
<tr>
<td></td>
<td>Additional fields will appear to add Original Language Names</td>
</tr>
<tr>
<td>Auxiliary Digital Token Mechanism</td>
<td>Protocol used to create an auxiliary digital token. If relevant protocol is not listed, please leave as “other” and specify the protocol details in the comments.</td>
</tr>
<tr>
<td>Auxiliary Digital Token Distribution Ledger</td>
<td>The DTI of a distributed ledger on which the digital token is operating. If relevant distribution ledger is not listed, please leave as “other” and specify the ledger details in the comments.</td>
</tr>
<tr>
<td>Auxiliary Digital Token Technical Reference</td>
<td>Element, such as a smart contract address, used to uniquely identify an auxiliary digital token’s origin on a distributed ledger technology platform</td>
</tr>
<tr>
<td>Digital Token Reference Implementation URL</td>
<td>Uniform Resource Locator (URL) pointing to the digital token’s reference implementation or software repository</td>
</tr>
<tr>
<td>Digital Token Unit Multiplier</td>
<td>Multiplier used to map from the unit of value stored on the distributed ledger to the unit of value associated with the digital token long name. For example unit multiplier for Bitcoin is 8 or 100000000</td>
</tr>
<tr>
<td>Add External Identifiers</td>
<td>Tick “Yes” if the token has any identifiers, external to this standard, that may be used to identify either the digital token or the underlying asset that this digital token represents.</td>
</tr>
<tr>
<td></td>
<td>Additional fields will appear to add either underlying asset or a digital token.</td>
</tr>
<tr>
<td></td>
<td>Please use the following format:</td>
</tr>
<tr>
<td></td>
<td>Type:Identifier, e.g. ISIN:GB0071262223 or ITIN:31R25SHC9</td>
</tr>
</tbody>
</table>
Functionally Fungible List of Tokens Registration Request

Functionally Fungible is defined as a list of tokens that are not technically compatible, but considered equivalent (e.g. TetherUSD on Ethereum and Omni Layer).

Fungible in this context means capable of mutual substitution between the individual units of digital asset.

Please note that the individual underlying tokens must have been issued a DTI prior to submission of this form for the registration to be accepted.

Listed in the next section are all the data elements for registration of functionally fungible group of digital tokens.

If relevant, use the comments section in the form to add any other details that will help DTIF to verify the application.

Functionally Fungible List of Tokens Form Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital Token Long Name</td>
<td>String containing the full name of the digital token, as represented in alphanumeric basic Latin characters</td>
</tr>
<tr>
<td>Functionally Fungible DTIs List</td>
<td>List all the DTIs digital tokens which are functionally fungible (Not technically compatible, but considered equivalent)</td>
</tr>
<tr>
<td>Reason for Classification</td>
<td>Please state the reason why these are classified as Functionally Fungible</td>
</tr>
<tr>
<td>Digital Token Short Name(s)</td>
<td>One or more short names or ticker symbols used to represent this digital token Multiple symbols can be added to the same identifier (if applicable)</td>
</tr>
<tr>
<td>Add original Language Name</td>
<td>Tick “Yes” if the token has a long or a short name in the original language that is different from the long short names already specified. Additional fields will appear to add Original Language Names</td>
</tr>
<tr>
<td>Functionally Fungible DTIs List</td>
<td>List all the DTIs digital tokens which are functionally fungible (Not technically compatible, but considered equivalent)</td>
</tr>
<tr>
<td>Add External Identifiers</td>
<td>Tick “Yes” if the token has any identifiers, external to this standard, that may be used to identify either the digital token or the underlying asset that this digital token represents. Additional fields will appear to add either underlying asset or a digital token. Please use the following format: Type:Identifier, e.g. ISIN:GB0071262223 or ITIN:31R25SHC9</td>
</tr>
</tbody>
</table>
DTI DATA ELEMENTS AND VALIDATION

This section lists all the data elements that are included in the registry and the relevant validation steps that DTIF performs at the time of registration submission.

In cases where provided normative data is missing or differs from official token sources or market consensus, DTIF will update the record and inform the registrant. If the registrant disagrees with the DTIF amendments, the registrant can raise an amendment ticket through the helpdesk. Further details on amendment and the dispute process can be found in Requests for Amendments and Disputes.

Private ledgers (Public Distribution Ledger Indicator=N) are validated against information supplied by the registrant, sources of validation are not made public by the DTIF.

In cases where some or all normative information is missing at the time of the registration submission, DTIF, at its discretion, will issue a provisional token. Normative data on the token must be populated within one month of the token issuance. If information is not updated during this time, the token will be deleted from the registry.

Normative Data Elements

The set of normative data elements are technical facts unique to each digital token that establish the 1:1 relationship of a digital token to its assigned DTI. This is a set of objective data that can be validated by the registry during the assignment process.

| Digital Token Identifier Type | The type is assigned to the token by DTIF based on the form used and official details of the token. Possible values: 0=Auxiliary Digital Token 1=Native Digital Token 2=Distributed Ledger Without a Native Digital Token 3=Functionally Fungible Group of Digital Tokens |
| Digital Ledger Technology Type | (Applicable only for Digital Token Identifier Types 1 & 2) The type is assigned to the token by DTIF based on the form used and official details of the token. Possible values: 0=Other 1=Blockchain |
| Genesis Block Hash | Validated and/or populated against the native block explorer on block 0. Where native block explorer is not available, a number of different random block explorers are used. |
| Genesis Block UTC Timestamp | Validated against official white paper, official press releases and/or source code of the token |
| Public Distribution Ledger Indicator | Validated against information supplied by the registrant |
| Auxiliary Digital Token Mechanism | Validated against the specified digital token ledger to ensure the Technical Reference exists on the specified ledger and on the correct mechanism |
**Functionally Fungible DTIs List**

Validated against the official site of the token. The tokens in the list have to be identical and issued by the same entity. The only difference between tokens should be the ledger that they are listed on.

---

**Informative Data Elements**

Data elements included in the registry if required, and/or provided by the registrant. In the event that informative data elements are disputed by other users, the registry record shall be noted as disputed and follow the dispute resolution process.

<table>
<thead>
<tr>
<th><strong>Digital Token Long Name</strong></th>
<th>Validated against official token explorer (if relevant) and/or commonly used market data aggregators</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Digital Token Short Name(s)</strong></td>
<td>Validated against links supplied by the registrant, official token explorer (if relevant) and/or commonly used market data aggregators</td>

**Fork Record Normative Data Elements**

Applicable only to records where Digital Ledger Technology Type = 1 (Blockchain) and where Digital Token Identifier Type is either 1 (Native Digital Token) or 2 (Distributed Ledger Without a Native Digital Token).

Terms such as hard fork and soft fork are sometimes used to distinguish backwards compatibility changes to the consensus mechanism of a blockchain. This document uses the term fork to encompass both scenarios.
If fork block height is submitted, DTIF would verify against the official block explorer of the token. All details are validated against the official white paper, official press releases and/or the source code of the token.

DTIF reserves the right to add to the fork records as and when they become public.

<table>
<thead>
<tr>
<th>A reference to the base record the fork record modifies</th>
<th>DTI of the underlying Digital Token.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fork Block Height</td>
<td>Block height of the block immediately after a fork has occurred.</td>
</tr>
<tr>
<td>Fork Block UTC Timestamp</td>
<td>Timestamp of the block immediately after a fork has occurred.</td>
</tr>
<tr>
<td>Fork Block Hash</td>
<td>Block hash of the block immediately after a fork has occurred.</td>
</tr>
<tr>
<td>Fork Block Hash Algorithm</td>
<td>Algorithm used to produce the block immediately after a fork has occurred e.g. SHA-256</td>
</tr>
<tr>
<td>Consensus mechanism change response</td>
<td>Possible values: Y/N</td>
</tr>
<tr>
<td></td>
<td>Indicates if consensus mechanism on the blockchain has changed between block just prior to fork to the block immediately after a fork has occurred.</td>
</tr>
<tr>
<td>Digital token creation response</td>
<td>Possible values: Y/N</td>
</tr>
<tr>
<td></td>
<td>Indicates if this token has been created as a result of a fork. For a given base record, this data element shall be Y for zero or one fork record.</td>
</tr>
</tbody>
</table>

DTI FORMAT

The DTI is displayed using capital letters.

The DTI is nine characters in length, consisting of the eight character (alphanumeric) basic number and a check character computed using the method specified in Annex A of ISO standard 24165.

The alphanumeric basic number excludes vowels (A, E, I, O, U) and the letter Y. The DTI will not start with zero.

The basic number of a DTI is randomly generated and intended to be semantically meaningless. In a case where a randomly generated identifier may inadvertently appear to be semantically meaningful, that identifier may be discarded at the discretion of the DTIF and a new identifier assigned.

Registrant shall notify DTIF if they become aware that the basic number of the DTI allocated and registered to the Digital Token is semantically meaningful in any language.

REQUESTS FOR AMENDMENTS AND DISPUTES

Any user can raise a request for amendment of data in the registry. All requests are validated against user supplied reasons for amendment and publicly available information. If the amendment is agreed by DTIF, the update is made in the registry and the user is notified of the change.
In a case where DTIF disagrees with the amendment, DTIF will provide the reasoning for disagreement, including any publicly available information. The user has a right to question the decision, in which scenario this request becomes a Dispute.

All Disputes are raised to the DTIF Product Advisory Committee, which makes the final determination. The record is marked as “Disputed” until the final decision.

**INFORMATION CLASS INDICATORS**

Each record in the registry is marked with status as either Provisional or Validated. In addition to this, each record is marked as either Private or Public.

**Validated**
Marked against a DTI record where all the data elements have been validated. The level of validation required for each data element varies as described in [DTI Data Elements and Validation](#). All the data elements that make up a validated DTI record are considered to be validated.

**Provisional**
Marked against a DTI record where one or more data elements have not been validated. The provisional record will either become validated once all the individual data elements have been validated, or deleted from the registry. All the data elements that make up a provisional DTI record are considered to be preliminary.

**Private / Public**
Every DTI is either Public or Private based on the Public Distribution Ledger Indicator. If the Public Distribution Ledger Indicator = N, then all the data elements that make up a private DTI record are considered to be private.

**REGISTRY TOKEN DATA ELEMENTS**

**Digital Token Identifier Type = 0 (Auxiliary Digital Token)**

- **Normative**
  - Auxiliary DT Mechanism
  - Auxiliary DT Distribution Ledger
  - Auxiliary DT Technical Reference

- **Informative**
  - Digital Token Long Name

**DTI REUSE POLICY**

DTIs assigned by the DTIF will never be reused.
GLOSSARY OF TERMS

Below is a list of terms where acronym details or definitions have been provided:

DLT   Distributed Ledger Technology
DTI   Digital Token Identifier
DTIF  Digital Token Identifier Foundation
RA    Registration Authority
